

Forensic science

By Jackie

What is forensic science?

Have you ever heard of forensic science? Forensic science is very interesting. Forensic science is when somebody or something dies and no one knows how they or it died. That's when they call in a forensic scientist. Forensic scientist's are kind of like detective. The reason they're like detectives is that

they solve mysteries about death. The reason they're not like detectives is that they only solve mysteries about death.

Being a forensic scientist is not all that easy because sometimes the murder can end up being a

cold case for a long time, sometimes even years. Also sometimes forensic scientists never find out the case but that only happens a little, for example when forensic scientists don't find any forensic information.

What skills you need to be a forensic scientist

There are only a couple skills you need to be great at to be a forensic scientist. You need to be great at science, chemistry and math. There are other things you should know if you're a forensic scientist to but you don't have to. Also the most important thing you have to be able to do is work with dead body's sometimes even smelly, buggy, and bloody dead bodies. And it my sound weird but you have to be really great at puzzles.

The reason you have to be really great at puzzles is that you usually take apart the human body to see if the bones have anything that's not supposed to be there. For example, if there's a gun shot in the body, a forensic scientist would have to take apart the body and take the bullet out. The reason they take the bullet out is because they have to find out who murdered the person. By taking out the bullet, they find out what gun it was from. After they take out the bullet, they study it.

By studying the bullet, they find out what gun it came from. They find out what gun it came from by the mark on the bullet. Every bullet has a different mark on it.

Forensic science shows

There are many forensic science shows in the world, but not all of them tell the truth. For example, *Bones* is about two forensic scientists, the two forensic scientists, but a lot of times it confuses with two cops. For example, on *Bones*, the two forensic scientists make arrests, and in real life, a forensic scientist cannot arrest anyone. Also, some forensic science shows tell you real cases. By real cases, I mean they reenact a case that really happened.
